Innovate, Replicate, Repeat:
Evidence-Informed Interventions that Work!

1

CONDUCT YOUR NEEDS ASSESSMENT

Identify key target populations, issue areas, and capacity building needs for your organization.

2

SET PROGRAM GOALS

Leverage your needs assessment to establish program goals for improving care and treatment for people living with HIV.

3

IDENTIFY APPLICABLE EVIDENCE-INFORMED INTERVENTIONS

You don't have to reinvent the wheel. Proven interventions exist.

The Special Projects of National Significance (SPNS) Program, the research and development (R&D) arm within the HRSA HIV/AIDS Bureau (HAB), supports the development of innovative models of HIV care and treatment and provides resources to support their replication.

SPNS initiatives respond to emerging needs and the changing health care landscape, as well as key target populations disproportionately affected by HIV, such as:

- Clinical practice transformation
- Correctional health
- Hard-to-reach populations
- Hepatitis C treatment
- HIT and data integration
- Latinos/as
- Multiply diagnosed homeless populations
- Opioid treatment
- Oral health care
- Social media strategies
- Supportive employment and housing services
- System linkages
- Transgender women of color
- Women of color
- Workforce capacity building
- YMSM

Through its demonstration projects, SPNS evaluates the design, implementation, utilization, cost, and health-related outcomes of care and treatment models. SPNS also promotes the dissemination and replication of successful interventions.

SPNS's Integrating HIV Innovative Practice (IHIP) Project develops technical assistance (TA) resources to facilitate the replication of SPNS evidence-informed interventions. IHIP resources include:

- Intervention guides
- Webinars
- Training manuals
- Curricula
- Pocket guides
- Fact sheets
- TA help desk

4

SELECT THE EVIDENCE-INFORMED INTERVENTION

You don't have to conduct a deep analysis. IHIP has done that for you.

IHIP TA resources describe the SPNS-funded evidence-informed intervention models and their outcomes along with the populations they served, communities in which they were implemented, required staffing and organizational capacity, as well as tips for replication and addressing challenges.

IHIP resources include recommendations for replicating the evidence-informed interventions on a budget and integrating them into existing health systems.
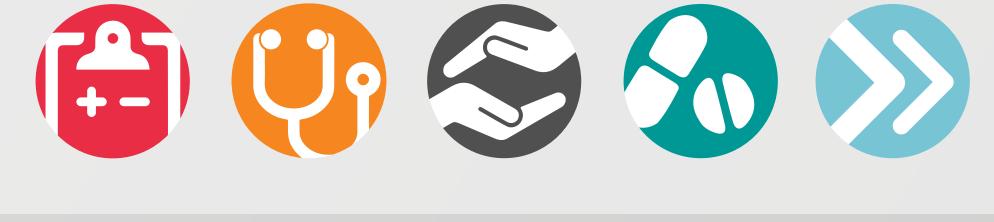

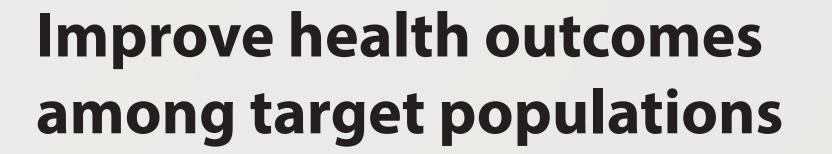

5

IMPLEMENT THE INTERVENTION

Using IHIP resources to leverage proven interventions, lessons learned, and best practices can help :
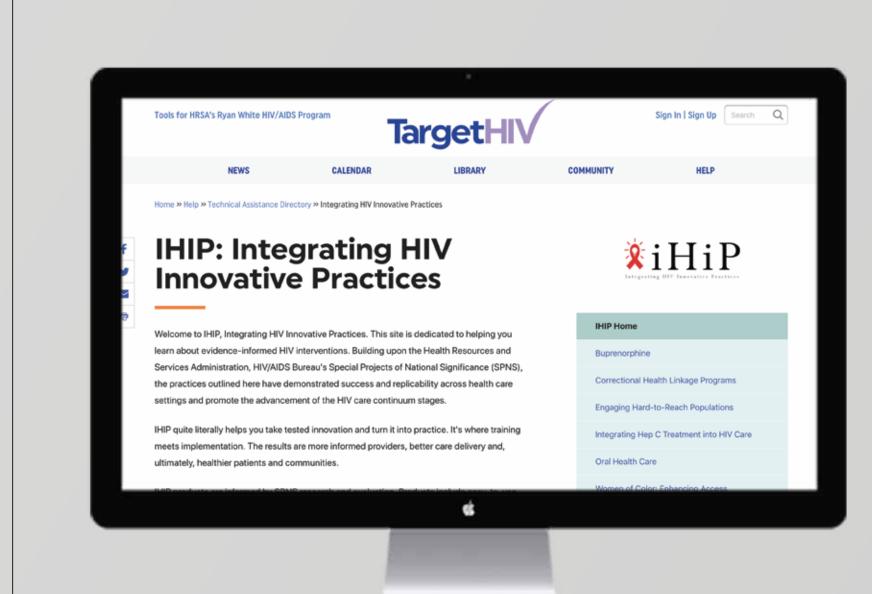

Advance the HIV care continuum

Improve health outcomes among target populations

Move towards HIV elimination in the U.S

Let us help you build a better program for a brighter future.

Access resources that will help you identify, select, and replicate evidence-informed interventions for HIV care and treatment by visiting the SPNS IHIP project: **https://targethiv.org/ihip**
