

## Ryan White Services Report (RSR) Data Completeness Rates, 2010-2020

**Chart 1: Completeness Rates for Demographic Data Elements Remain High**

Providers are reporting complete responses for key demographic data elements. Completeness has improved over the years to nearly 100% for HIV risk factor, housing status, health care coverage, and poverty level, and has been consistent over time.

## Chart 2: Completeness Rates for Clinical Data Elements Have Improved Significantly

This chart shows that although providers initially struggled with reporting viral load test results, CD4 count test results, and prescription of ART, completeness rates from 2010 to 2020 have greatly improved and remained high. However, clinical data reporting was about 2% lower for both viral load and CD4 on the 2020 RSR, which may reflect a drop off in lab tests performed during the COVID-19 pandemic.
